

RSI Environmental Environmental Policy

RSI Environmental is a treatment and recycling centre for contaminated soil and residual hazardous material using high temperature thermal desorption (HTTD) technology. RSI Environmental's mission is to transform contaminated soil, a non-renewable resource, into a clean and reusable material by definitively treating it. This mission comes from a sustainable development perspective, allowing future generations to live in a healthy environment.

We recognize our responsibility to society and, with the goal of minimizing both our environmental footprint and that of our clients, we have given ourselves a mandate to apply the principles of industrial ecology and circular economy. Inspired by values like respect, commitment and innovation, RSI Environmental intends to be proactive about environmental matters in its business management.

In order to ensure that the current policy is applied, RSI Environmental has put in place an effective environmental management system (EMS), registered under the ISO standard 14001:2015. To do this, we have committed ourselves to:

- Protecting the environment;
- Complying with laws and regulations in place, as well as other voluntary standards that we can subscribe to;
- Continually improving our environmental management system and our environmental performance;
- Creating and maintaining safe and healthy work conditions.

Our annually revised environmental objectives reflect our commitments and we have put in place all the necessary resources to reach them.

This policy is accessible to employees and the public.

The director general is responsible for the application of this policy.

Jean-François Landry Eng.
Director General
